

As a dentist in Connecticut since 2004 I can personally attest to the hardship of energy bill month after month. I remember that for the first few months since opening my practice the average electric bill was in the ballpark of \$100 in 2004. Fast forward 12 years and it is close to \$400 with very prudent use. Thanks to solar panels, installed last year, I can breathe easier knowing that my solar energy bill will remain at the fixed price per kWh of electricity for the next 20 years. As per electrical utility bill, it is worth to note, that although I get less of kWh of energy every month, it is double what I pay for solar. The answer is simple: if you want to empower customers, give them ability to connect to solar network, if you want to empower utility industry, vote against it. Please remember you can be voted out by people one day.
